Compressed Air Filtration for Welding

July 1, 2007

For Immediate Release

Air Preparation Products for Clean, Dry Shop Air

A ready supply of clean, dry air is a must for every welding shop. Today's busy shop owners can't afford the expensive and time-consuming maintenance that comes from bad air.

From plasma cutting to grinding to parts blow-off, shop air applications require air preparation products designed for the task. Motor Guard Corporation now offers a **complete line of quality U.S. made air preparation products for welding shop applications.** Two of these components are highlighted below.

RG-4520

AC-4525

The **RG-4520 Regulator** provides accurate pressure regulation and quick response to changes in supply pressure. Unique construction and quality components deliver reduced set-point creep at high pressure, a problem with lower quality regulators. Unit is rated at 100 CFM of flow and output pressure range is 0-150 PSI. A high-visibility, scratch and solvent proof glass faced pressure gauge is included.

The **AC-4525 Air Control Unit** combines the precision of the RG-4520 Regulator with an efficient water trap and particulate filter. Rated at a full flow of 100 CFM and 150 PSI, the Motor Guard Air Control Unit provides air cleaning and control in a single package. Mounted at the drop before each tool in the shop, a 40-micron rated sintered bronze element removes dirt and debris and a metal bowl with manual drain traps moisture.
